Topic 02: Make the workflow explicit

Foundations: Python, Cloud and a reproducible workspace

M00 Foundations Pre-Module | Topic 02

TOPIC 02

Make the workflow explicit

Use an environment, version control and clear responsibility boundaries.

First checkpoint: prove the environment is explicit

```
1 python --version
2 python -m venv .env
3 source .env/bin/activate
4 python -m pip install pandas scikit-learn
5 git init
6 git status
7
```

Caution – Do not treat an activated environment as documentation

Record dependencies in a requirements file or equivalent lockfile so the session can be reproduced later.

A practical responsibility map

Key Takeaway – Reproducibility begins before modelling

A clear project boundary makes it possible to tell which code, data and credentials created an analysis.
